

MINT CUP CARE

Already potted! Keep the cup moist while roots settle in.

YOUR 9OZ MINT CUP

You received a mint cutting already planted in a 9oz cup with FoxFarm soil. No transplanting today - just help it settle in.

1 WHEN YOU GET HOME

Place the cup where it gets bright indirect light or gentle morning sun. Check the soil with your finger. If the top feels dry, water lightly until the soil is evenly moist.

1 NO ROOTS YET?

Don't panic. Some cuttings finish rooting after they are already in soil. Keep the soil gently moist, avoid harsh afternoon sun, and give the stem time to anchor.

2 FIRST 3-5 DAYS

Keep the cup somewhere protected while the cutting adjusts. Soil should stay evenly moist - never bone dry, but never sitting in standing water.

3 ONCE IT PERKS UP

When you see healthy new growth, gradually increase sunlight. Mint grows well in sun to partial shade. Rotate the cup so it grows evenly.

4 MOVE UP LATER

When roots fill the 9oz cup or growth speeds up, move it to a bigger container with drainage. Mint spreads fast, so a pot is usually the best home.

QUICK REFERENCE

LIGHT

Bright light / morning sun

WATER

Evenly moist, not soggy

TEMP

55-85 F

CUP

9oz with FoxFarm soil

HARVEST

After new growth
