Cole Crop Plant Instructions

Start Cole Crops INDOORS

certain crops like broccoli, brussels sprouts, cabbage and cauliflower (and others like Okra) can be started indoors for early harvesting, or they can be direct-seeded outdoors after all danger of frost pass.

Sow seeds about .5 inches deep about a month to a month and half before last frost in individual containers like large peat pots. For effective germination, keep the temperature above 70 degrees F.

Harden before setting plants out around last frost.

If seeding directly outdoors, wait until dangers of frost have passed. Sow seeds .5 inches deep and about 2 inches apart (about 4 inches for cabbage) in rows of 36 inches apart. Thin to 18 to 24 inches apart. In warmer regions sow a second crop 10 to 12 weeks before last Fall Frost.

Prime Temp
40 F - 75 F

Prime pH
6-8

Hardiness Zones
3-10

Germination Rate: about 75%
