Corn Plant Instructions

Important note: Seed will not germinate below 65 degrees
Sow seed directly into a sunny area after dangers of frost past and soil is over 65 degrees. Sow seed about 1 inch deep and 6 inches apart in rows of 36 inches apart. Germination takes around 7 to 10 days. Thin to one plant every 10 to 12 in when plants are about 4 inches tall. Plant in blocks of 4+ rows for better pollination. Make sure it's watered well, especially when they begin to tassel. Lengthen the grow season by successively sowing or by growing of varying maturities. Isolate super sweet varieties (shown as "sh2" on the packet if there) by at least 25 feet from other non-super sweet varieties (200ft in large field). If no room to separate, then stagger the sowing dates or use different maturities so that the super sweets tassel 10 days before or after non-super sweet varieties.

Prime Temp
60-75°F

Prime pH
6.0-7.0

Hardiness Zones
3-11

Germination: 75% and up!
