All Bean Types Plant Instructions

Pole/Bush Beans are a cooler weather crop and should be planted in early spring just as soon as the soil can be worked (about 45 degrees F.) and again about two months before first frost for fall crop. Sow seeds in sunny area (full sun) in well drained soil about 1 inch deep and 2 inches apart in rows of at least 2.5 feet apart. You can inoculate beans with nitrogen for bigger increases in yields. Seeds germinate in 7-14 days. Do not thin. Beans, particularly the taller varieties, perform best when supported. Ideally place a trellis between a double row sown 6 inches apart and allow both rows to trail onto the same trellis.

Prime Temp

60 F - 80 F

Prime pH

5.5-6.8

Hardiness Zones

5-13

Germination Rate: 70%
