Pepper Plant Instructions

Choose a warm and sunny spot 8-10 weeks before planting outdoors. Sow seeds no deeper than 1/4 inch in not too deep containers with a sterile seed mix. (I've used fertile/rich organic soil) Keep Moist! Pepper seedlings will appear in about 7-21 days (80 degrees is best) bottom heat may be needed. Transplant to individual containers when seedlings got at least 2 pairs of leaves. Before planting outside, condition seedlings by moving to a sheltered spot outside for a week. Start off with only hour or two exposure, then start increasing time gradually get it out there til it's there day and night.

Prime Temp	Prime pH	Hardiness Zones
65-75°F	6-6.8	3-9

Germination Rate: 80% or more
