Vine/Crop Plant Instructions

Start crops just like cucumbers, gherkins, gourds, melons, pumpkins, squash or watermelons indoors in short season areas for early harvest, or direct seed outdoors after all danger of frost has passed.

If starting inside, sow seeds .5 inches deep 3 to 4 weeks before last frost in individual containers like large peat pots, as the roots cannot withstand transplant shock.

Germinate at temperatures above 70-80 degrees F.

Harden off about a week and transplant outdoors a week after all dangers of frost have passed, as vine crops can't survive cool soil. If seeding directly outdoors sow seeds 1 inch about 3 inches apart in circular hills of 5 or 6 seeds. Space hills 5 to 8 ft apart and rows 5 to 6 ft apart in. When seedlings are 3 to 6 inches tall, thin hills to 2 to 3 seedlings. Fertilize every 4 to 6 weeks and water often.

Prime Temp
65-80 F

Prime pH
6-6.8

Hardiness Zones
4-11

Germination Rate: about 75%
